Checklist Edit Page: Structure and Component Explanation

Overview

The checklist edit page is a key part of the checklist management application, allowing users to view, edit, and manage a specific checklist along with its steps and instances. This document explains the overall structure of the page, its key components, and how the rendering functions work together.

Page Structure

The page uses a hierarchical structure implemented through various render functions that each handle specific sections of the UI. The main function `render_checklist_edit_page()` orchestrates the entire page layout by calling specialized render functions for each section.

Key Components

1. Container

The entire page is wrapped in a `Container` component with `ContainerT.xl` styling and "space-y-4" class for consistent spacing between elements. This ensures the content is properly centered and responsively sized across different screen sizes.

2. Navigation Bar

Function: `render_navbar()`

- Positioned at the top of the page
- Provides application-wide navigation options
- Likely includes links to dashboard, checklists list, and other key areas
- May include user account controls or application branding

3. Page Title
